... For all of us who have tried several different approaches in the

past, finding a library that provides such solution is a pain. So we have decided to share with you the most useful collection library that we have found in the last years. It is useful when you are trying to develop the following applications: ... Since the Java 5 release, the programming language has become more popular. If you are working with Java 5 applications, you will probably notice that there is a constant need to debug the code. In this case, you can take advantage of the new

Java Debugger (JDB) included with the JDK 5.0. This tool is very useful for debugging any kind of Java code. We have found it very helpful in a lot of occasions. Java

Debugger (JDB) Description: ...

We will introduce you to this new tool included with the Java Platform of IBM. This tool allows you to debug any Java application.

It is a high level language debugger, included with the JDK. The aim of this Java Debugger is to help you to debug any Java applications. It works by

intercepting the execution of the Java program in a native way. It is useful to... Developers who develop in C or C++ will definitely be familiar with the concept of class hierarchy. This is a very common pattern when programming with C. Class inheritance provides developers with the possibility to reuse code. The Java language has no direct equivalent to class inheritance. But there is another way to achieve class inheritance. Java allows... If you are searching for a library that

KEYMACRO ANSI C macros

used to define a macro constant

KEYMACROs in double quotes is
optional. Macro defines are
processed by the preprocessor, and
the result is treated as the input to

SYNOPSIS The classic use of
KEYMACRO is to define a macro
constant, such as one that has
special meaning to the
preprocessor. For example, if you

would like to enable or disable a warning, you could define the **KEYWORD** as **#-W[-]** and have all preprocessor invocations of the macro emit the specified warning.

SYNOPSIS IMPORTANT

NOTE: Macros can be redefined, typically through the use of include files. The resulting list of

macros, as compiled by the compiler, is a list of preprocessor statements that replaces the list in the source code. This means that macros defined with the same name and in the same source file are processed with different results. Roughly analogous to the ANSI C `#ifdef/#endif` statements, macros can be defined in the source code or in a header file, but only one definition can exist at any one time. The use of macros in the form of keywords that are used to define and manipulate

macros is common in ANSI C-like programming languages. Other programming languages, such as Python and Ruby, also offer a similar feature.

Immutable Collections for Java is a useful library that provides developers with a collection of immutable/persistent classes that allow the developer to add and remove values by creating collection copies that share the structure with the original one. The library comes with a set of indexed lists, tree-based maps and iterator classes for browsing through the collection items. It includes implementations of the

List interface, MutableList and MutableSet, ArrayList, TreeSet, TreeMap and ImmutableList, ImmutableSet, ImmutableList and ImmutableMap. The class ImmutableSet includes a class ImmutableSortedSet, which extends TreeSet. Getting Started The core API is defined in java.util.Collections. Immutable Collections for Java is available as a JAR file and is a bundle of immutable and immutable classes for both Java SE and Java EE. It includes implementations of the

Java Collections Framework (JCF)
List, ArrayList and SortedSet.
Each collection class is given a
level of static safety: with one
exception, all classes in this bundle
are serializable. See also Java

Functional differentiation of
CD4+ T cells into distinct subsets

is an important process in the immune response to pathogens. The multifunctional T cells differentiate into subsets with restricted functions after the early stimulation of the antigen. These subsets are differentiated from naïve T cells (naïve CD4+ T cells) with an effector phenotype, after the occurrence of multiple signals (signal 1 and 2) and costimulatory molecules (signal 3) \[[@CR31]\]. Based on previous studies, the CD4+ T cell differentiation is associated with the co-expression

of the T-bet and Eomesodermin (Tbet/Eomes) transcription factors. Therefore, the markers of the Th1 cell lineage (Tbet) and the markers of Th2 cell lineage (Eomes) are usually used to assess the polarization status of CD4+ T cells \[[@CR32]\]. In this study, the number of Th1/Th2 cell-related markers (Tbet/Eomes) in the chronic lesions of GC was higher than in the acute lesions (Fig. [4](#Fig4){ref-type="fig"}). After a brief stimulation, most naïve CD4+ T cells differentiate

into Th1 cells, which produces IFN- γ and TNF- α to induce acute immune response. While in the chronic lesions of GC, the antigen-stimulated CD4+ T cells differentiate into Th2 cells, which produces IL-4 to induce antibody production and disease clearance \[[@CR33]\]. These observations suggest that the Th1/Th2 polarization status may play an important role in the development of GC. However, we have not provided further data to prove that the Th1/Th2 polarization has a

role in the pathogenesis of GC.
The Th17 cell lineage is a novel cell lineage characterized by the expression of IL-17 \[[@CR34]\].
Accumulating evidence suggests that Th17 cells play an important role in the pathogenesis of GC.
